Requirements Analysis

1. Problem Statement

Students in our section use YouTube and Spotify to listen to music while studying. Both of these require internet and therefore will cause problems if there isn't any. Many students use music to help them concentrate when studying for long periods of time.

2. Target Audience

This project will target students who listen to music while they study, and who already have audio files.

Primary audience: Long term students who study for extended periods of time, whether it be at home, b. in dormitories or at school. They will have unreliable, limited or shared internet. They use music to help them concentrate but will no longer be able to use streaming services due to loss of signal or running out of mobile data.

These students will normally have a phone/laptop with limited storage and no paid streaming service.

Secondary audience: Students with MP3 files on their device, such as lectures they have downloaded, ripped audio from their own CD's or files shared between classmates.

They do not have an easy way to play these files in an organized way. This project is not for users looking for a music streaming, discovery or online library. This player can only play audio files already on the device.

3. Scope

This project is an offline MP3 player. It does not allow for streaming, discovery or licensing of music.
